

Final Project

Description:

Congratulations on surviving CS 175! You have learned everything you need to learn to become a full-fledged graphics engineer. For your final project, it is time to show off what you can do on your own, and to have fun!

There are four parts to completing your final project:

1. Your presentation during final exam period
2. A demo video of your project
3. Your presentation slides
4. Your source code, data, compile script – everything to recreate your project

Presentation:

Your team will have XXX (TBD) minutes to present during class. We will randomly sort the presentation order and will announce the order at the start of the class.

You should have slides for your presentation. While the specifics of how you want to show off your project are up to you, your slide and presentation should include:

- A title slide, including names of your group members
- Background explanation of what your project is about, including:
 - What is the source of the inspiration (e.g., what video, paper, etc. your project is based on)
 - The library, tools, etc. you used in implementing your project (e.g., C++, GLSL, Unity, etc.)
 - “Sales-pitch”: what is unique about what you did (e.g., modifications to the original source idea, technical challenges, why this is creative, etc.)
- A live demo
- A discussion / future work / conclusion: This is open-ended, but the point is to share your thoughts on what you learned, what you can do to improve the project, what you might have done differently, etc.

Submission:

You are required to submit the following:

1. A demo video of your project
2. Your presentation slides
3. Your source code, data, compile script – everything to recreate your project
4. Whatever else you want to tell us or share with us

It is important to note that Darby and I will be using the video and your slides to grade your final . Because of this, your slides and video together should tell the story you want to tell. In other words, do not expect us to remember your pitch from your

live presentation during class. Your videos and slides need to be sufficiently detailed for us to appreciate your work. If the video and the slides are not enough, feel free to include additional information (e.g., documents, code, images, etc.)

Finally, don't forget to submit your source material. While Darby and I won't be trying to recreate your project, we need to have this material for documentation purposes.

Groups in Canvas:

And for the love of everything holy, please remember to add your name to your team in Canvas. You should be able to join a team under the “Final-project” group.
